Unique Solutions

When building a new home or renovating an existing one, first focus on the home's energy use in order to reduce carbon emissions and utility costs.

Deep energy reductions are achievable by optimizing the efficiency of the home's thermal envelope and mechanical systems while adjusting the occupants' energy usage behavior.

Energy efficient homes have air tight and super insulated perimeters, high performance windows, ENERGY STAR appliances, and appropriately designed HVAC systems.

BEFORE

FEATURED PROJECT

⊕ LOCATION: Darien, Connecticut

⊕ ARCHITECT: Studio DiBerardino

⊕ DESCRIPTION: A second floor addition to provide bedrooms and a home office was the motivation for the conversion of this 1950's Cape Cod style home to better suit its neighborhood filled with picturesque historic homes. An inviting covered porch spans the entire front of the home providing an outdoor room that engages the pedestrian active street. Cedar clapboard replaces the vinyl siding on the existing portion of the house and also clads the new additions. Other custom interior and exterior details help to complete the traditional updating of the home.

 ON THE JOB

DETAILS:

• Architectural Products

by Studio DiBerardino currently debuts on our website studiodiberardino.com. Look for the Architectural Products tab in the right margin of the home page. We can now offer interior construction products, elements and accessories that are custom designed by our firm and handcrafted by talented artisans in local shops for your next interior project.

- Louis DiBerardino is participating in a four part Green Home Series seminar sponsored by AIA Connecticut on sustainable residential design.
- "On The Job" features a project under construction in Westport, CT previously included in our Fall 2008 newsletter's "On The Boards" section. The project is an expansion and upgrade of a 1960's basic, Colonial style home scheduled to be completed later this Spring by **Celotto Properties**.
